

Trends in Drug-Related Hospital Separations, 1999-2018

New South Wales

- There were 20,844 hospital separations with a drug-related principal diagnosis in New South Wales in 2017-18.
- This is equivalent to 269 hospitalisations per 100,000 people, as compared to 223 hospitalisations per 100,000 people in 1999-00 ([Figure 1](#)).
- The rate of hospitalisations was higher among males than females in 2017-18 (301 versus 238 hospitalisations per 100,000 people).
- In 2017-18, the rate of hospitalisations was highest among the 20-29 age group, followed by the 30-39 and 40-49 age groups (484, 455, and 406 hospitalisations per 100,000 people, respectively).
- The rate of hospitalisations was highest where there was a principal diagnosis indicating amphetamines and other stimulants (64 hospitalisations per 100,000 people; [Figure 2](#)).

Figure 1. Age-standardised rate (per 100,000 people) of drug-related hospital separations, by sex, New South Wales, 1999-00 – 2017-18.

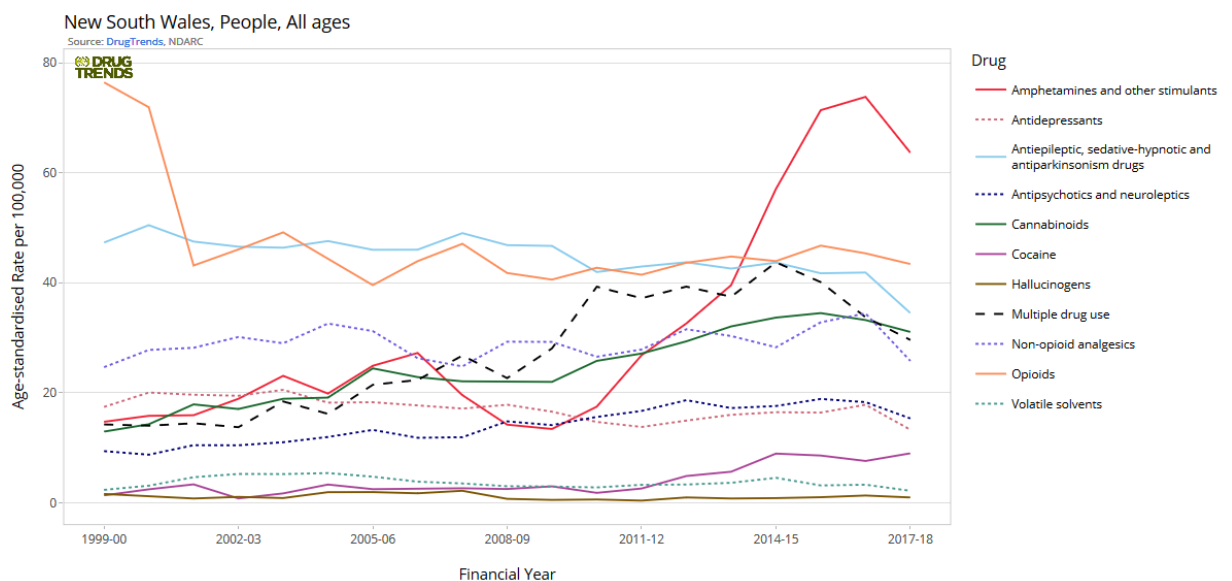

Figure 2. Age-standardised rate (per 100,000 people) of drug-related hospital separations, by drug identified in the principal diagnosis, New South Wales, 1999-00 – 2017-18.

Funding

The Drug Trends program is funded by the Australian Government Department of Health under the Drug and Alcohol Program.

Acknowledgements

We would like to acknowledge the Australian Institute of Health and Welfare for data from the National Hospital Morbidity Database.
